Сергей Смирнов

AI-эксперт и методолог, к.т.н.

Мастер системных и научно-практических подходов к построению AI-разработки, руководитель RnD лаборатории

23 года в Software Engineering, 15 лет в Computer Science, 4 года в GenAI

Александр Кожин

Архитектор GenAI решений

Практикующий эксперт по AI-driven разработке, эксперт в архитектуре сложных ИТ-систем

20+ лет разработки ПО от программиста до технического лидера

LLMSTART.RU

AIRND.RU

MCP

Sample App

- Chat interface, using a LLM with tools that can access a user's Github account
- Claude will need a set of tools to access the user's data

Tool Functions

- To handle all of Github's functionality, we'd have to create an incredible number of tool schemas and functions
- **This is all code that we (developers) have to write, test, and maintain**

Our Server

Model Context Protocol

Shifts the burden of tool definitions and execution onto **MCP Servers**.

MCP Servers

MCP Servers provide access to data or functionality implemented by some outside service.

Common Questions

Who authors MCP Servers?

Anyone can create an MCP server implementation. Often, service providers themselves will make their own official MCP implementations. For example, AWS might release an official MCP server with tools for their various services.

How is this different from calling APIs directly?

MCP servers provide tool schemas and functions already defined for you. If you want to call an API directly, you'll be authoring those tool definitions on your own. MCP saves you that implementation work.

Isn't MCP just the same as tool use?

This is a common misconception. MCP servers and tool use are complementary but different concepts. MCP servers provide tool schemas and functions already defined for you, while tool use is about how Claude actually calls those tools. The key difference is who does the work - with MCP, someone else has already implemented the tools for you.

The benefit is clear: instead of maintaining a complex set of integrations yourself, you can leverage MCP servers that handle the heavy lifting of connecting to external services.

MCP Client

The **MCP Client** provides communication between your server and a MCP Server

Transport Agnostic

Communication between the **Client** and **Server** can be done over many different protocols

MCP Communication

The MCP specification defines different types of messages that can be exchanged

MCP Communication

The MCP specification defines different types of messages that can be exchanged

Connect your AI applications to the world

AI-enabled tools are powerful, but they're often limited to the information you manually provide or require bespoke integrations.

Whether it's reading files from your computer, searching through an internal or external knowledge base, or updating tasks in an project management tool, MCP provides a secure, standardized, *simple* way to give AI systems the context they need.

How it works

1

Choose MCP servers

Pick from pre-built servers for popular tools like GitHub, Google Drive, Slack and hundreds of others. Combine multiple servers for complete workflows, or easily build your own for custom integrations.

2

Connect your AI application

Configure your AI application (like Claude, VS Code, or ChatGPT) to connect to your MCP servers. The application can now see available tools, resources and prompts from all connected servers.

3

Work with context

Your AI-powered application can now access real data, execute actions, and provide more helpful responses based on your actual context.

Building MCP with LLMs

 Copy page

Speed up your MCP development using LLMs such as Claude!

This guide will help you use LLMs to help you build custom Model Context Protocol (MCP) servers and clients. We'll be focusing on Claude for this tutorial, but you can do this with any frontier LLM.

Preparing the documentation

Before starting, gather the necessary documentation to help Claude understand MCP:

1. Visit <https://modelcontextprotocol.io/llms-full.txt> and copy the full documentation text
2. Navigate to either the **MCP TypeScript SDK** or **Python SDK repository**
3. Copy the README files and other relevant documentation
4. Paste these documents into your conversation with Claude
